

# A bridge across industrial reality, AI work, and enterprise adoption.

## The affirmative case

Vontier needs more than a model specialist or an innovation storyteller. It needs a leader who can connect customer problems, hardware, controls, software, data, AI, field work, production operations, governance, economics, and adoption. Russell's career is unusually coherent around that bridge.

## Direct execution

Designs AI workflows, readiness models, retrieval patterns, human review, evaluation, governance, dashboards, standard work, and operating mechanisms.

## Industrial credibility

Advanced electronics, robotics, machine vision, quality systems, manufacturing, regulated autonomous systems, and high-reliability customers.

## Operating scale

24/7 Amazon operations, remote regional buildout, global stakeholder work, launch discipline, escalation, and distributed adoption.

## Executive translation

Can move between technical detail, frontline work, portfolio economics, customer outcomes, governance, and board-level narrative.

HOW TO USE THE PROFILE

# Place Russell at the seams.

## Highest-leverage seams

| Seam                            | Leadership contribution                                                                                                      |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Business unit / enterprise      | Clarify what remains local and what becomes a shared contract.                                                               |
| Hardware / software             | Translate physical constraints, device behavior, controls and installed-base reality into architecture and workflow choices. |
| AI / human authority            | Make retained judgment, override, escalation and evidence explicit.                                                          |
| Pilot / production              | Bring operating ownership, quality, monitoring, support, adoption and economics into the proof.                              |
| Customer / technology ecosystem | Harvest outside-in signals without allowing vendor novelty to define the roadmap.                                            |
| Strategy / VBS                  | Turn innovation into a measurable continuous-improvement system.                                                             |

## Interview proof move

Use one Vontier scenario and ask Russell to map the decision, evidence, authority, production owner, adoption path, and reuse asset live. This tests the actual work rather than résumé vocabulary.

## Leadership promise

"I will make the portfolio easier to see, the decisions easier to make, the risks harder to hide, and the strongest work easier to scale."
